

CypressAllure comments:

Login.test.ts:

1. To navigate the homepage, the user should click the "inmotion hosting" image. I would change the baseUrl to <https://www.inmotionhosting.com/> in the config file;
2. To run the test, you have to add {uncaught: exception} to the beforeEach hook;
3. Credentials for the project are not valid;
4. The Login button link on the homepage is not visible because it has CSS property: display: none;
5. The Login page is not visible because it has CSS property: display: none.
6. Locators signinLink(), passwordTxt(), signinBtn() are not valid;
7. After clicking signinBtn on the login page, the user navigates to the blank page with the message: "All active session data across all domains are cleared." QA can't check all assertions after the login;
8. Also, I noticed that we have a captcha on the login page but we don't have it in the code;
