CypressAllure comments:

To test this project, I pulled the repository, created a new branch – "Semiankiv" and tested all features in it;

Login.test.ts:

1. To navigate the homepage, the user should click the "inmotion hosting" image. I changed the baseUrl to https://www.inmotionhosting.com/ in the config file;
2. To run the test, I add {uncaught: exception} to the beforeEach hook;
3. I don't have valid credentials for the project;
4. The Login button link on the homepage is not visible because it has CSS property: display: non. I used {force: true} to disable error-checking;
5. The Login page is not visible because it has CSS property: display: non. I used {force: true} to disable error-checking;
6. Locators signinLink(), passwordTxt(), signinBtn() are not valid. I changed them;
7. After clicking signinBtn, the user navigates to the blanc page with the message: "All active session data across all domains are cleared." I can't check all assertions after the login;
8. Also, I noticed that we have captcha on the login page but we don't have it in the code;
